

Subjective Questions

Prepared by- Diwakar Kumar

Q1. Which are the top three variables in your model which contribute most towards the probability of a lead getting converted?

Answer-

To identify the top three categorical variables that drive lead conversion, we look at the **highest positive coefficients** in your Logistic Regression model. These are the factors that most strongly increase the likelihood of a lead becoming a customer.

Top 3 Conversion Drivers

1. **Tags_Closed by Horizzon:** This variable has the highest positive impact. It indicates a lead has successfully completed an interaction or evaluation process.
 - *Action:* Prioritize these leads immediately; they are your "hottest" prospects.
2. **Tags_Will revert after reading the email:** This indicates a lead who is actively engaging with provided information.
 - *Action:* Have your sales team reach out promptly while the lead is still in the "evaluation" mindset.
3. **Lead Source_Welingak Website:** This specific source consistently delivers higher-quality leads than generic channels like "Google" or "Direct Traffic."
 - *Action:* Allocate more marketing budget to this channel and ensure leads from here are routed to your top sales performers.

Strategic Summary for Sales/Marketing

To optimize your outreach, the sales team should use these insights for **Prioritized Routing**:

- **Automated Alerts:** Set up alerts for whenever a lead is updated with the "Closed by Horizzon" or "Will revert" tags.

- **Targeted Allocation:** Direct all leads from the **Welingak Website** to your most experienced closers to maximize revenue.
- **Performance Monitoring:** If these variables' predictive power shifts, you can adjust your sales strategy in real-time to remain efficient.

By focusing on these three indicators, you move from "random calling" to **data-driven, high-precision outreach**.

Q2.What are the top 3 categorical/dummy variables in the model which should be focused the most on to increase the probability of lead conversion?

Answer-

To identify the categorical (dummy) variables that most strongly drive lead conversion, we look at the **highest positive coefficients** in your Logistic Regression model. These features have the strongest positive impact on the probability of a lead converting.

Based on your model's performance, here are the top three variables to focus on:

1. Tags_Closed by Horizzon

- **Significance:** This variable consistently shows the highest positive coefficient. It signals a lead that has reached a definitive, positive stage in the sales process.
- **Business Strategy:** These are your "hottest" prospects. Sales representatives should prioritize these leads immediately to finalize the conversion.

2. Tags_Will revert after reading the email

- **Significance:** This tag indicates a lead who is actively engaging with provided information and has explicitly stated they are evaluating your services.
- **Business Strategy:** Since these leads are in the evaluation phase, the sales team should reach out promptly with tailored content or a follow-up call to address any lingering doubts.

3. Lead Source_Welingak Website

- **Significance:** Leads originating from this specific website source have a statistically higher probability of conversion compared to those from generic sources like "Google" or "Direct Traffic."

- **Business Strategy:** The marketing team should allocate more budget toward this channel, and the sales team should route leads from this source to their most experienced closers.

Strategic Summary for Sales & Marketing

To maximize conversion rates, your team should employ a **prioritized routing system**:

- **Automated Alerts:** Configure your CRM to notify the sales team instantly whenever a lead is updated with the "Closed by Horizon" or "Will revert after reading the email" tags.
- **Quality Allocation:** Direct all leads originating from the **Welingak Website** to your top-tier sales representatives to ensure higher capture rates.
- **Data-Driven Focus:** By concentrating resources on these three variables, you transition from random outreach to a high-precision strategy that ensures your best efforts are focused where they are most likely to yield revenue.

Q3. X Education has a period of 2 months every year during which they hire some interns. The sales team has around 10 interns allotted to them. So, during this phase, they wish to make the lead conversion more aggressive. So, they want almost all the potential leads (i.e., the customers who have been predicted as 1 by the model) to be converted and hence, want to make phone calls to as much of such people as possible. Suggest a good strategy they should employ at this stage.

Answer-

To maximize lead conversions during this aggressive 2-month hiring phase, your strategy should shift from "selective efficiency" to "**maximum capture**." Since you have 10 extra interns, you have the bandwidth to increase outreach volume.

Here is a recommended strategy:

1. Adjust the Probability Threshold (The "Aggressive" Metric)

Typically, a threshold of 0.5 is used to balance Precision and Recall. For this phase, **lower your threshold to 0.3 or 0.35**.

- **Why:** Lowering the cutoff expands the pool of leads flagged as "Potential." While this increases "useless calls" (False Positives), it ensures you catch almost every lead that *might* convert (higher Sensitivity). Your interns will absorb this increased call volume.

2. Tiered Lead Allocation

Don't distribute leads randomly. Use your interns effectively by segmenting the lead pool:

- **Tier 1 (High Probability Leads - 0.7+):** Assign these to your **senior sales staff**. These are high-intent leads that need expert closing skills.
- **Tier 2 (Medium/Low Probability Leads - 0.3 to 0.69):** Assign this high-volume bucket to your **10 interns**. This is a volume game; even a small conversion rate from this larger pool will significantly boost your total numbers.

3. Prioritize by "High-Impact" Signals

Even within the intern-managed list, prioritize based on the strongest predictors found in your model:

- **Tag-Based Priority:** Immediately call any lead tagged as "**Closed by Horizzon**" or "**Will revert after reading the email.**"
- **Source-Based Priority:** Filter leads originating from the **Welingak Website** first, as they have a proven higher likelihood of converting.

4. Defined Outreach Cadence

To ensure interns are working effectively, set a structured follow-up rhythm:

- **Day 1:** Initial call + personalized follow-up email.
- **Day 2:** Second call (during a different time of day to catch them when available).
- **Day 4:** Final touchpoint (Email or SMS).

Summary for Management

By lowering the probability threshold to **0.3**, you expand the total addressable pool. Assigning this expanded pool to your 10 interns while reserving high-probability leads for senior staff ensures you are aggressively exploring every potential opportunity in the database without overwhelming your top performers.

Q4. Similarly, at times, the company reaches its target for a quarter before the deadline. During this time, the company wants the sales team to focus on some new work as well. So, during this time, the company's aim is to not make phone calls unless it's extremely necessary, i.e., they want to minimize the rate of useless phone calls. Suggest a strategy they should employ at this stage

Answer-

When the company has already met its quarterly target, the strategy must shift from "**Volume/Aggression**" to "**High Precision**." The goal is no longer to capture every potential lead, but to protect the sales team's time by focusing exclusively on "sure-shot" opportunities.

Here is the strategy to minimize useless phone calls and maximize efficiency:

1. Shift to "High-Precision" Threshold

During this phase, you should **increase the probability threshold** of your model, for example, to **0.80 or 0.85**.

- **Why:** By raising the cutoff, the model will only flag leads as "Potential (1)" if it is extremely confident in their conversion.
- **The Benefit:** This dramatically improves your **Precision**. You effectively filter out the "noise" (leads that are unlikely to convert), ensuring that phone calls are only made when the probability of success is exceptionally high.

2. Prioritize Precision over Sensitivity

While the aggressive phase focused on *Sensitivity* (catching every lead), this phase focuses on **Precision** (ensuring every call made is a winner).

- **Action:** Direct the sales team to call *only* those leads that rank in the top 5–10% of probability scores. All other leads should be moved to a "passive nurturing" status.

3. Implement Low-Touch Automation

Since the goal is to avoid phone calls, replace "active outreach" with "passive engagement":

- **Automated Nurturing:** Instead of calling, set up automated, personalized email drip campaigns or WhatsApp messages. These keep the brand top-of-mind without consuming human hours.
- **Inbound Triggers:** Use the system to alert the sales team *only if* a lead interacts significantly with your content (e.g., clicking a link in an email or revisiting the pricing page). These actions act as a "green light" that a call has now become "extremely necessary."

Summary Strategy for Management

Metric	Aggressive Phase (Hiring)	Target-Met Phase (New Work)
Primary Goal	Maximize Revenue	Maximize Team Efficiency
Probability Threshold	Low (~0.3)	High (~0.8+)
Sales Action	Proactive Outbound Calling	Reactive/Highly Selective Calling
Focus	Sensitivity (Recall)	Precision

Business Suggestion: During this phase, instruct the sales team to treat their time as a premium asset. By filtering for only the absolute top-tier leads, the team can effectively meet their "new work" objectives while maintaining high conversion standards on the few leads they do choose to pursue.
